Musk could Hire Linus Torvalds and DHH to audit the old stack, and Jose Valim / Chris Mccord to write a new version...

Aright mate...

Sorry you're snowed under there.

- You intuitively know the Twitter stack is wrong, but you don't (understandably) have the exact knowledge to call their bluff on it piece by piece.

- They are going to throw the scale thing back at you again and again, to cover up for all the Intelligence Community infrastructure they are running, and their messy codebase.

IMO, you could pursue a parallel, two-pronged strategy.

SOFT

Diplomatically ask them to sit down and see if they can hit reasonable performance goals over 3-6 months, reducing and rewriting their current stack. It's very hard, cos they'll probably bluff and sabotage you.

Maybe you could hire DHH of Rails as a consultant. Twitter was originally built in Rails before they moved over to Scala, or whatever it is now.

IMO, you could hire three separate third parties to do a code audit... but keep it respectful and light.

That is the softly-softly approach, that you could do on one hand.

But the real fun is the other prong...

Leave them to do their slow respectful rewrite at their pace.

Keep making them answer to outside parties, publicly, if need be, and face down their tantrums... along with their predictable "You have no idea about twitter scale, kid" - This is true, but they will also use it as their bluffer trump card again and again.

So defer to your auditors.

Hire Linus Torvalds FFS. He will (possibly) excoriate them. Even the mention of his name, and they will start shaking.

~O~

Meanwhile.. try a different strategy.

Continued in Part Two...

[Edit Post](#)[Remove Post](#)[Report Abusive Post](#)[Report Copyright Violation](#)**Re: Musk could Hire Linus Torvalds and DHH to audit the old stack, and Jose Valim / Chris Mccord to write a new version...**

Hire a completely new team of people, 3-5 Erlangists, or Phoenix/Elixir people, to do a ground-up rewrite of the Twitter stack.

IMPORTANT:

This should be a totally separate project. Don't tread on the toes of those engineers. Don't even need to tell them. Keep it completely siloed, secret, walled-garden etc.

- Take the code from the client. The Javascript, the CSS, + HTML. You paid for that. There are no scaling issues here.

Now, with the new project, which you could call Twitter-Garden, Twitter-X, whatever... just quietly and peaceably rewrite Twitter from zero, on a relaxed timeframe, because you're not interfering with the other engineers.

Erlang, Phoenix and Elixir are built for YUUGE scale.

~O~

Once you have a version for a couple of hundred users working fine, showcase it publicly.

ADMIT that this is a huge engineering challenge. Play that UP, don't play it down. Be humble, and admit that things might break. That's good PR. Half the public will be crossing their fingers for you to succeed. The other half, hoping you fail. lol. So ALL eyes will be on you.

"Musk's Daring High Wire Act" scream the headlines...

~O~

Now you have demoed a smallish lightweight Twitter with 10,000 users, and load tested it. OK, 10,000 is nothing, but you've got it. It looks the same as the old one.

They will tell you, again and again, that it will break at scale. This is true, but they are also BS artists covering up for their soyboy incompetence.

SLOWLY PORT USERS OVER, COUNTRY BY COUNTRY

Then, start to PORT old users to the new Twitter, over 3-12 months, a country at a time, or a databases/server at a time.

2-5 percent of users at a time.

So, for example, 2 months into the PORTing phase, you are going to have, say, Hong Kong and Poland running on Twitter-New, and the rest of the world on Twitter-Old.

Make all discussions as public as possible. Don't let them bluff you privately, because they will do that. But if they know hacker news types are watching, they will try less BS.

You may feel isolated, but Twitter devs are not exactly liked right now, cos you proved 50% of them at least are superfluous.

Obviously, its not easy, but take your time. Make it a public journey.

You could hire Chris Mccord and Jose Valim if you wanted. Get on the phone with DHH of Rails to be an auditor. He will not take any BS from those cucks. Chris and Jose run a different framework from DHH, but they could probably end up working together. DHH for auditing the old stack, Chris Mccord and Jose to rewrite Twitter-New separately.

DHH + Torvalds for auditing.
Valim and Mccord for the rewrite.

Separate teams.

They'll set you right, IMO.

tl;dr...

Rewrite it from the ground up in semi-secret, and port users over slowly.

Take your time, make it public... the PR angle is "Musk's High Wire Act"...

OK that is an overview...

Instead of butting heads with those eejits, build something better to the side.

If you run a respectful audit and an aggressive rewrite concurrently, you'll be able to find a good porting strategy. Get the four named parties to think about it, in private.

That's all.

Just brainstorming for fun...

Peace!

Doozle

Re: Musk could Hire Linus Torvalds and DHH to audit the old stack, and Jose Valim / Chris Mccord to write a new version...

Now if you really really want to hit the top notes, hire Chris Coyier, or whoever, to build 5 new Twitter designs, that you can cycle through with a top-right toggle/cycle button. New colors, new palletes, new fonts.

Then the public's eyes will start to pop.

I could help you make some new designs if you want, as I am proficient on codepen, but I really just wrote all this for my own amusement.

Peace

Re: Musk could Hire Linus Torvalds and DHH to audit the old stack, and Jose Valim / Chris Mccord to write a new version...

There's many ways you could make a port easier...

Chop it up by country and time...

What about displaying Tweets from 2022 forward only at first?

So step one, only in Australia, for example, and only 2022 forward.

How about running Twitter X concurrently, and only posting there. You most loyal 10,000 followers might come along.

So many ways you could dissect the task to make it stable and safe.

Reach out to Hacker News, Reddddit, Quuora, wherever. Humbl ask them how they could go about a port. Keep the whole thing public, so they can't accuse you of megalomania.

They are burning him in the comments here. I still think they're cucks.

[\[link to kotaku.com \(secure\)\]](#)

No one is saying it's easy. It might be incredibly hard. But if you are not interfering with the existing stack, you can't be accused of "incompetent meddling" - **you're just building a new model.**

No doubt some programmers can be naive. The other side is, corporate cog programmers can be conceited, and find clever ways to keep their job.

Remember, they are probably running bots to increase view counts.

Keys:

- Chop up the task by country/server and time.
- Hire competent famous coders.
- Build something new.
- Constantly talk to Hacker News. Keep it humble, open and good humoured.

Why does Elixir need less servers (fraction of the infrastructure previously required)? Is it a fact or a myth that it can replace 150 servers with 2-5 servers?

It is not a myth, but the 150 => 5 ratio is not a rule of thumb. You won't get an automatic 30 or 60 fold consistent increase in throughput all the time for everything.

In general yes, Elixir will be way faster than Ruby, or PHP, or Python.

In a more realistic scenario, for a very complex application with many different kinds of bottlenecks throughout (applications don't live in a vacuum, they have to deal with databases, cache servers, other kinds of external storage or external services integrated with many different and inefficient protocols such as JSON-RPC), maybe you will be able to go down from 10 servers to 2 servers. A 5 fold increase is more reasonable for the majority of scenarios.

Re: Musk could Hire Linus Torvalds and DHH to audit the old stack, and Jose Valim / Chris Mccord to write a new version...

Most of the back doors and deliberately obfuscated code will be in the messaging database, right? That where they trade pizza.jpg, so it will be fog-walled and fenced in with layers of red-herring databases.

They do not want you going anywhere near there.

What if, on a new Twitter, you told the public,

"Regretfully, to save 20 million a month in server costs, we aren't able to port your old messages to Twitter-New for the next six months. This will allow us to save XXX million per month."

The lib-tard coders will have a field day. Everyone else will shrug.

The public is far more tolerant of dropping features than the libs who want you to fail.

You could sweeten users with a ton of new browser features, which will cost you ZERO to serve, as it all stays in the client. Move to a fat client, more browser heavy model for new fun features.

I think messaging is a significant drain on resources. Rewriting it from zero would save you a lot of money, from many angles.

This guy does a very fair, unbiased view of the issues Elon is facing.

Re: Musk could Hire Linus Torvalds and DHH to audit the old stack, and Jose Valim / Chris Mccord to write a new version...

Could probably code it in notepad over the weekend drinking a few redbulls..

Would LOOK the same... FEEL the same.. but wouldn't have any tracking bullshit or any moderation or anything to control ANYTHING..

I'm guess that's how it started.. and then they needed to create a business model.

Let's be fair the ONLY business model for this type of ticker boards is either to control the information or get advertisers...

Which normally advertisers want to CONTROL the outlets they use so again comes back to the control factor.

Let's face it.. Twitter will ALWAYS be crap unless it's moderated in GLP fashion with very LITTLE censorship.

Quoting: **Anonymous Coward 84984441**

It's true there are a ton of good Twitter clones already on Github. So why all those useless techies?

As you hinted, a lot of those staff are intelligence assets running covert tracking. I think the recent big tech purge got rid of a lot of these cucks.

The first part of the business model should be cutting off the dead weight, which Musk is doing well.

I bet a lot of those yearly outgoings are an outright scam. If they are charging him for 2FAuth every time he sends a message, what else are they doing?

I guess you need a tech auditing firm to check outgoings. Have auditors running round everywhere. Honest programmers will have nothing to fear. Make it as open as possible. See who shrugs, see who quakes in their boots. See who pretends to shrug and secretly quakes.

I think he needs to hire at least 3-5 independent groups of code and check-cash-outflow auditors. The way he pulls people up publicly is hawkish, but those parasites deserve it.

The public has always intuitively hated big tech, so they will be happy to see those idiots booted out.

I honestly feel they are running up a billion USD worth of extra server costs [er year out of pure malice and parasitism.

So think in terms

If

Re: Musk could Hire Linus Torvalds and DHH to audit the old stack, and Jose Valim / Chris Mccord to write a new version...

Product / Subscribers

The subscriber model is very healthy.

Brainstorming

- You could allow extra designs for subscribers. Twitter Dark, Twitter White, Twitter, Burgundy etc. What about an old school ascii version? ha. Cycle through skins with a 5-way toggle button.

- I think a weekly, Google style all hands hangout, which subscribers could watch online, and ask questions, would be a big draw. I'd involve the public in this as much as possible.

- Reddit created a sense of community, which Twitter never managed to quite achieve. Maybe subscribers could "own" hashtags, and create their own communities. You could reserve public hashtags like politics, or food. Don't want anyone owning that... but I'd like to own a hashtag. Would make Twitter more personal. Or maybe brainstorm something which is halfway between a hashtag and a community. Maybe doublehashtags ##Reforestation could be a thing.

- Marrying crowdfunding could save Twitter. The controllers will not want this. Allow subscribers to link to crowdfunding projects. Keep the crowdfunding projects on Kickstarter and Pozible etc for now. No need to host fundraisers on your own infrastructure. Just let subscribers use Twitter to promote their crowdfunding projects. Show them in a special feed, or just in a hashtag, or doublehashtag. ##TwitterFinance ##TwitterFunding ##BirdFund, whatever...

Some people will be really into this, some against. So let people opt out with a single click.

When Musk starts helping the homeless and dispossessed on Twitter, The Galaxy will start to flip on its head.

It's a cold winter. People are bored and hurting.

Do something brilliant

~O~

Re: Musk could Hire Linus Torvalds and DHH to audit the old stack, and Jose Valim / Chris Mccord to write a new version...

Aright mate...

Sorry you're snowed under there.

- You intuitively know the Twitter stack is wrong, but you don't (understandably) have the exact knowledge to call their bluff on it piece by piece.

- They are going to throw the scale thing back at you again and again, to cover up for all the Intelligence Community infrastructure they are running, and their messy codebase.

IMO, you could pursue a parallel, two-pronged strategy.

SOFT

Diplomatically ask them to sit down and see if they can hit reasonable performance goals over 3-6 months, reducing and rewriting their current stack. It's very hard, cos they'll probably bluff and sabotage you.

Maybe you could hire DHH of Rails as a consultant. Twitter was originally built in Rails before they moved over to Scala, or whatever it is now.

IMO, you could hire three separate third parties to do a code audit... but keep it respectful and light.

That is the softly-softly approach, that you could do on one hand.

But the real fun is the other prong...

Leave them to do their slow respectful rewrite at their pace.

Keep making them answer to outside parties, publicly, if need be, and face down their tantrums... along with their predictable "You have no idea about twitter scale, kid" - This is true, but they will also use it as their bluffer trump card again and again.

So defer to your auditors.

Hire Linus Torvalds FFS. He will (possibly) excoriate them. Even the mention of his name, and they will start shaking.

~O~

Meanwhile.. try a different strategy.

Continued in Part Two...

to audit the old stack, and Jose Valim / Chris Mccord to write a new version...

Twitter has a good front-end team. Use them more, IMO.

Every browser-only feature they roll out costs you NOTHING in server money.

Ask Codepen people, Chris Coyier, etc... to brainstorm some new features.

~O~

Messaging, that's where the enemy is.

That's where they track people, run the blackmail ops, trade those videos, etc.

Is messaging essential to Twitter? Twitter is about documenting the news...

If messaging was to be pared down to reduce server costs, no one would really care. You could just say it's a temporary measure to save money. Then you could purge the messaging team, and rewrite it. Hire Jan Koun and Brian Acton to consult. Or just hire any ex-What's App people, or someone good with Erlang messaging.

That was why I started this thread. Cos of that conversation with the engineer who challenged him. He had to back down then. In 6 weeks he'll know better. That's why he needs to do an independent stack audit.

The brains are out there. Hire some tech heavyweights for 10 hour audits. Get them to write reports and recommendations. Keep it all open, if possible.

"Brian Acton audits Twitter codebase" is big news in Hacker News land.

He intuitively knows the stack is a mess, but he doesn't have the granular knowledge to explain why. Fair enough, he's new. I intuitively knew vaccines were BS, way before I studied the ingredients.

- The code is all customized, allowing them to obfuscate all the black(mail) projects they are running. It also allows them to drain funds by ramping up server costs, and getting kickbacks from their friends running the server companies.

- Why aren't they using any standardized technologies? Off-the-shelf software allows for easier onboarding, and easier auditing. They are writing their own garbage Basilisk code, so they can keep their jobs, and keep outsiders out of their clique.

- Why is the codebase so brittle and coupled? In that conversation, Musk said, "when you make one change, it affects 17 other things". It should not be like that. Granted, I am a Dunning-Kruger sufferer, but I still know something's off.

- Would the code pass an open source audit with Hacker News? **No**. They'd probably tear it to pieces.

For the next 3-6 months, they're going to be on the back foot.

They're going to say:

**YeahButTheresNoWayThatWouldWorkAtTwitterScale.
YeahButTheresNoWayThatWouldWorkAtTwitterScale...**

until they are blue in the face.

But we know they are half-BSing. They're hiding their black projects and incompetent customizations.

He already got rid of 80% of staff, and it's still running. So these geniuses are nowhere near as essential as they think they are.

Parasites customize for a reason.

You can sidestep all these hassles by doing a separate code-rewrite, from the ground up, in Phoenix/Elixir... then showcasing it once it can handle a million users. Keep it separate, don't interfere with the current stack...

...write something new.

Then they won't be able to throw the

"OmgICantBelieveYouSuggestedThatItWouldNeverWorkAtTwitterScale

card that they will play all Winter.

The auditors will flush them out.

Follow the Henry Ford principle:

I don't know the answer to your question, but I can hire someone who does

So apparently, from the vid you linked, Musk is a "Laughing stock" amongst those Soy-Techies. I empathize with him. When I took over as Chief Janitor of Donkey Island LARPer community, a lot of people laughed at me, and still do.

Anyway....

So...

1) He could drop 100 grand on a code audit, if he has that money. How much is a heavyweight auditor? 300USD per hour? I don't know. Each ten hour audit will probably save him millions, if not billions, because they're bleeding him dry under the hood. The 2FA debacle is proof of that. I bet they are running bot farms to jack up server costs.

2) Release as much info about the stack and codebase to Hacker News, Reddit, Stack Exchange etc... Invite them to ask intelligent questions to the Tech Leads of messaging, servers, whatever. They will bluff Musk, but they will eventually get caught on the backfoot, and start gabbling in public.

So, Musk... humbly steps out of the way and admits the stack is beyond him. That's perfectly acceptable. A tech CEO isn't obliged to know everything.

Step to the side and let the auditor-sharks ask incisive questions, until everyone realizes they are bluffing.

Meanwhile, do a separate rewrite and showcase a 1 million user version that costs a measly million per month to run.

Musk was perfectly right to call the stack crazy.

The engineer was perfectly right to challenge him, and ask him to explain it. Then Musk went silent.

So he has to go hit the books, hire the right people, and come back and burn the team once he figures out what's going on.

tl;dr they are hiding black projects and parasitism behind walls of customized NIH code.

Daozen appears to be mentally impaired, but harmless.

NIH allows you to hide all kinds of abuses. Abuses that cost the company millions, or even billions.

These fkers will be smoked out by Spring.

How can a couple of dozen 30-something coders expect to write something better than software engineering projects than have been around for more than a decade?

If you want to customize, take something off the shelf and change it slightly. Don't deliberately mangle it, so you become the "In House Expert Who Cant Be Fired".

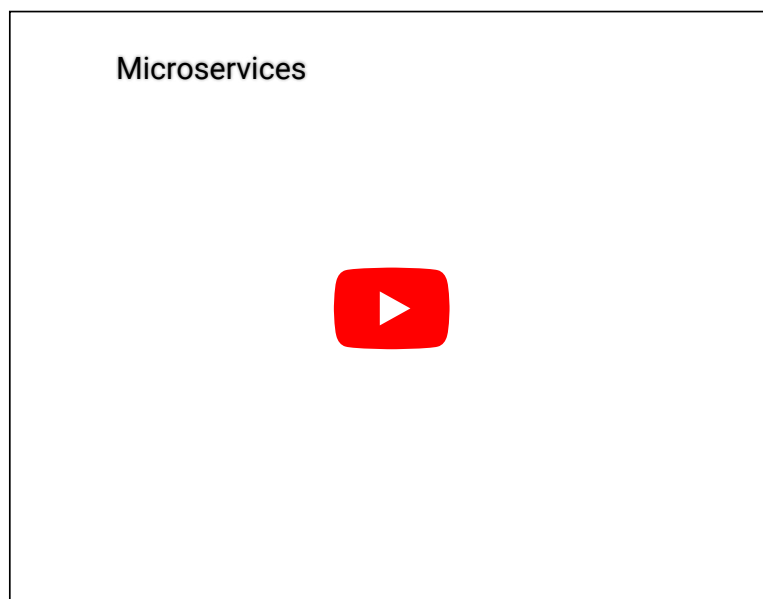

omg, if we fire harry, messaging will go down.

Architecture should not be like that.

~O~

This video is very funny, and shows exactly how they are trying to BS Musk..

Tons of coupled, customized, components that are all written in house.

Study Coupled Vs Decoupled Microservices.

Overly customized infrastructure benefits them, cos they get to look like domain experts over their own jackass code. The can hide the black projects, tracking, and pizza vid trading.

Musk said the codebase was brittle.

Customized code gives them an excuse to jack up server costs, cos only the Twitter team knows what's going on. It's much harder to audit a customized codebase. So may ways thye can drain cash.

The auditors will find it.

At some point, their "We have to do it like this cos of Twitter Scale" bluff is going to be called, but it'll take a few months.

Smoke them out, Soy-Tech-Lead, by Soy-Tech-Lead.

If they're going to burn and embarrass him publicly, he should burn them back.
